Abstract:

PROBLEM TO BE SOLVED: To provide a remote monitoring system with which versatility is improved and cost down can be attained.

SOLUTION: A central processing unit(CPU) 3 on the central side and a general-purpose personal computer(PC) 11 on the terminal side are connected by an ISDN line or private LAN, the general-purpose PC loads an internet browser software and receives a real time access program from the CPU while using this software, and the change of a display picture is performed by using this program. The CPU transmits the real time access program to a remote terminal when accessing the remote terminal, holds display information in an HTTP format and periodically changes only the changed part of the display information. The general-purpose PC 11 is used for transmitting image data between the remote side and the job site side as well.
